The Benefits of Using Superior Fertilisers Rock Mineral Based Fertilisers

Not all Rock Minerals are beneficial for use as a fertiliser. Superior Fertilisers only use beneficial minerals as ingredients in our granular fertiliser products such as colloidal rock phosphate and volcanic rock that are carefully selected for their benefit to soil health, stability and plant growth, not for their price.

In our view there is no point using a mineral that is already present in existing soil or using benign type minerals such as road base as a filler, some of these non-beneficial minerals can also contain Toxic levels of heavy metals such as aluminium, mercury, lead cadmium and arsenic, where as our products do not.

Fertiliser and much much more…..

Over 26 different types of microbes are granulated into our mineral based fertilisers to allow for releasing of phosphorus and other nutrients in our product. Mycorrhiza fungi (VAM), Rhizobium and Bacilli (Bacillus megaterium) are the main movers and shakers involved in release of phosphorous from our base products, re-activating accumulated soil phosphorus and minimising nutrient leaching.

Our promise to you the Farmer and the end consumer is this. “We will continue to use only top quality ingredients in our products "no Muriate of potash {high Chloride content} or cheap benign fillers etc".

We have over 20 years of proven results and will not be going down the path of jeopardising our high quality over price. We will never forget our roots and will always be prepared to custom blend down to a 1 ton minimum to help reduce your application costs. Our aim is to supply high quality fertilisers and excellent customer service at a cost effective price.

Remember

Nutrition is not just about Raw analysis, but actual nutrient availability to your crop!
